CEP—NEE

What Is Generative AI?

- AI that creates text, images, audio, and code
- Used in healthcare, finance, retail, and education
- Growing fast due to high accuracy and easy access

Productivity Growth & Economic Value

- AI could add **\$2.6–4.4 trillion** to global economy yearly
- Could raise U.S. GDP by **\$477B–\$1T** per year
- Automates repetitive tasks → workers focus on high-value work

Job Disruption & Displacement

- 6–7% of U.S. jobs could be displaced
- Many impacts are temporary or transitional
- 60% of jobs in developed countries are “exposed”
- “Exposed” = tasks change; jobs not always replaced

Income Effects & Inequality

- Workers may lose ~4% of **earnings** on average
- Routine / low-skill jobs are most affected
- High-skill workers may see wage increases
- Demand for digital & complementary skills rises

Labor Market Dynamics

80% of workers have at least 10% of tasks affected

19% may have 50%+ of tasks affected

AI can complement workers more than replace them

Reskilling is essential for future job stability

AI in Warfare & Security

30+ countries developing autonomous weapons

Risk: lethal decisions without human control

Large-scale AI surveillance systems expanding

Predictive policing already used in the U.S.

Cybersecurity & Information Warfare

AI improves threat detection speed

But also enables faster cyberattacks

Deepfakes increased **900%** from 2019–2024

AI misinformation impacting global elections

Ethical & Human-Centered AI

Transparency & explainability

Fairness and bias prevention

Privacy-by-design

Inclusive design with diverse users

Continuous monitoring for safety

Conclusion

- AI creates major economic value
- But risks: job loss, inequality, surveillance, warfare
- Need ethical design, safety rules & reskilling

Question:

How can society balance AI innovation with protecting workers, privacy, and global security?

Thank You
